Outline			

Introduction	Design 000000	Evaluation 00000	Conclusions
Introduction			

- Traffic analysis is crucial for developIment of network systems
- New features in modern systems
  - Multicore
  - Multiples queues in network cards
- Pktgen: packet generator at high rates inside Linux Kernel

Introduction	Design 000000	Evaluation 00000	Conclusions
Network analysis			

Diferent aproaches

- Dedicated hardware: Ixia IxNetwork, Spirent SmartBits
- Software based:
  - Libraries: Pcap, Ncap, DashCap
  - User space: Iperf, Netperf, NetPIPE, LMBench, Ttcp, nuttcp, Mausezahn, D-ITG, Harpoon, RUDE, BRUTE

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- Kernel space: Pktgen, Kute
- Network processors: Caldera Technologies LANforge-FIRE, TNT Pktgen, BRUNO

uction

Design 000000 Evaluation 00000

## Outline

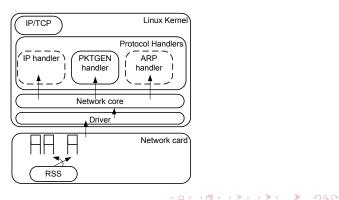

- ◆ □ ▶ → 個 ▶ → 注 ▶ → 注 ■ ∽ � � ♡ � @

Introduction	Design ●00000	Evaluation 00000	Conclusions
Architecture			

- Each CPU has its counters and variables for the different flows or different NICS
- Multiqueue support
- Load balancing (configured via SMP affinity)

Introduction	Design o●oooo	Evaluation 00000	Conclusions
Operation			

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

#### Layer 3

- Advantages
  - No device dependent and more generic
  - Transparent to other communications
  - The reception is made by the kernel
- Drawbacks
  - Less performance (Theoretically)

Auto-configuration

- New pktgen header
- Configure packet at the beginning (pkts to send, bytes to send)
- Reset counters

Introduction	Design 00●000	Evaluation 00000	Conclusions
Receiver metrics	(1)		

- Packets / Byte Received
  - Counters
- Packet / Byte loss
  - Offline. Subtract (Data extracted from initialization)
- Throughput
  - Time first packet arrive, Time last packet arrive

$$Throughput = \frac{packets received}{end time - start time} (pps)$$
$$Throughput = \frac{bytes received \times 8}{end time - start time} (bps)$$

\*ロ \* \* ● \* \* ● \* \* ● \* ● \* ● \* ●

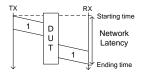

Introduction	Design 000●00	Evaluation 00000	Conclusions
Receiver metrics (	(II)		

• Inter-arrival time: avg, var, max, min

Inter arrival time  $= T_{current} - T_{last arrival}$ 

- Jitter: avg, var, max, min
  - Necessary constant rate
  - Method used: Inter-arrival
  - Subtract of two consecutive inter-arrival times

• Latency: avg, var, max, min

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Introduction	Design 0000€0	Evaluation 00000	Conclusions
Aplication int	ereface		

Control:

- Transmission:
  - rate [rate in Mbps]
  - ratep [rate in pps]
  - config [0 or 1]
- Reception:

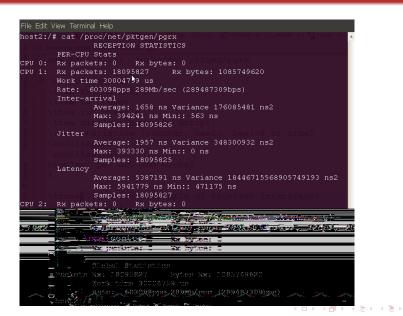

new proc file: /proc/net/pktgen/pgrx

- rx [device]
- rx\_reset
- rx\_disable
- display [human or script]
- statistics [counter, basic, basic6 or time]

Conclusions

## Outline

▲□▶▲圖▶▲≧▶▲≧▶ ≧ のQ@

Introduction	Design 000000	Evaluation •••••	Conclusions
Scenario			

- Intel(R) Xeon(R) CPU E5520 at 2.27GHz (Quad-Core Hyperthreading)
- 3 GB of RAM (DDR3 1333MHz)
- 4 Intel 82576 Gigabit Network (2 × Dual Copper Port)
- 2 Intel 82599EB 10-Gigabit Network (1 x Dual Fibre Port)

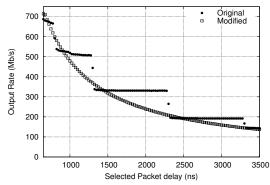

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Bifrost Distribution.

Kernel: net-next-2.6 (2.6.34-rc2) (April 2010)

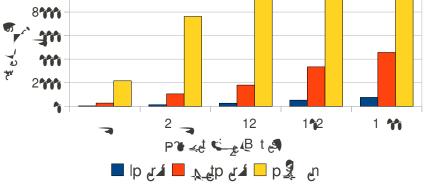

Introduction	Design 000000	Evaluation 0●000	Conclusions
Transmission rate			

- Changed resolution from microseconds to nanoseconds
- New commands for a direct control
- Accepted in the Linux Kernel (11 June 2010)

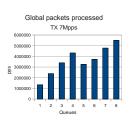

Rate obtainted with different delays (Packet size: 64Bytes)

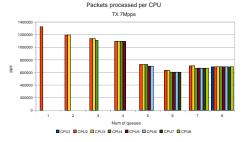

Introduction	Design 000000	Evaluation 000●0	Conclusions
Throughput			

#### RX: depens on num CPUs and type

(a) Receiver with different number of RSS queues

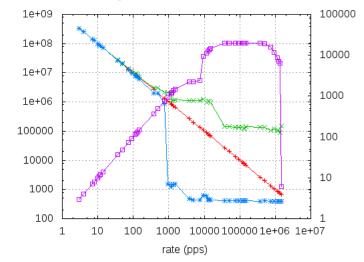

(b) Packets processed per CPU

Introduction	Design 000000	Evaluation 00000	Conclusions
Outline			

Introduction	Design 000000	Evaluation 00000	Conclusions
Conclusions			

- Used new features of modern network cards and SMP systems
- Receiver side statistics for different scenarios
  - Counters, basic, basic6, time
- Receiver is a powerful tool to understand how the Linux kernel behave
  - Receiving packets in SMP
  - Inter-arrival time and jitter
  - Latency in function of the rate
- Displaying results in human and script readable
- Integrated in current version of pktgen
- Available in:
  - TX: vanilla Linux Kernel (since 2.6.35)
  - RX: http://tslab.ssvl.kth.se/pktgen and Bifrost

## Thank you for your attention Any question?

Design 000000 Evaluation 00000

# Backup slides

Introduction	Design 000000	Evaluation 00000	Conclusions
Linux Network (I)			

Basic elements in network subsystem:

- Socket buffer (skb)
- Net device

Packet reception

- Interrupt driven
- Polling

NAPI. Advantages of both of them

- Low load (interrupt)
- High load (polling)
- Moreover: Direct access to device memory and no queues

(日) (日) (日) (日) (日) (日) (日) (日) (日)

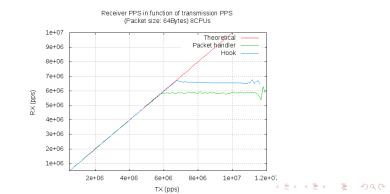

Introduction	Design 000000	Evaluation 00000	Conclusions
Pktgen Features			

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- MPLS, VLAN, IPSEC
- IPv4 and IPv6
- Customized packets with multiples addresses
- Clone packets to improve performance
- Multi queue
- Proc file systems as user interface
- Control the delay between packets
- UDP to send its headers

Introduction	Design 000000	Evaluation 00000	Conclusions
Hook			

- Avoid IP process
- Modification of the network core (dev.c)
- O Check if pktgen packet
- Process packet with pktgen (if pktgen, packet drop)
- **③** Otherwise, packet continues its path to other protocols

Introduction	Design 000000	Evaluation 00000	Conclusions
Header split			

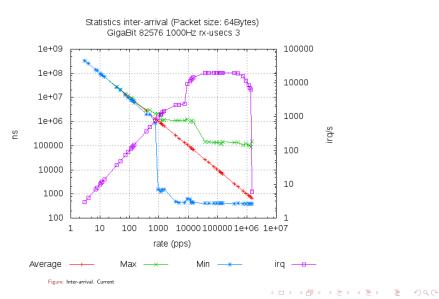

- Header + Data in different memory regions
- IP stack is were most of the perfomance is drop

Test	Received Rate (No hook)	Received Rate (Hook)
Split headers	5.8 Mpps	6.64 Mpps
NO Split	6.5 Mpps	6.74 Mpps
