

Package ‘Organism.dplyr’

January 28, 2025

Title dplyr-based Access to Bioconductor Annotation Resources

Version 1.34.0

Description This package provides an alternative interface to Bioconductor 'annotation' resources, in particular the gene identifier mapping functionality of the 'org' packages (e.g., org.Hs.eg.db) and the genome coordinate functionality of the 'TxDb' packages (e.g., TxDb.Hsapiens.UCSC.hg38.knownGene).

Depends R (>= 3.4), dplyr (>= 0.7.0), AnnotationFilter (>= 1.1.3)

Imports RSQLite, S4Vectors, GenomeInfoDb, IRanges, GenomicRanges, GenomicFeatures, AnnotationDbi, rlang, methods, tools, utils, BiocFileCache, DBI, dbplyr, tibble

Suggests org.Hs.eg.db, TxDb.Hsapiens.UCSC.hg38.knownGene, org.Mm.eg.db, TxDb.Mmusculus.UCSC.mm10.ensGene, testthat, knitr, rmarkdown, magick, BiocStyle, ggplot2

License Artistic-2.0

Encoding UTF-8

RoxygenNote 7.2.3

Collate src.R filter.R table-handlers.R extractors.R
extractor-methods.R select.R utils.R join.R zzz.R

VignetteBuilder knitr

| BasicFilter-class | <i>Filtering src_organism objects</i> |
|-------------------|---------------------------------------|

Description

These functions create filters to be used by the "select" interface to src_organism objects.

Usage

```

AccnumFilter(value, condition = "==")
AliasFilter(value, condition = "==")
CdsChromFilter(value, condition = "==")
CdsIdFilter(value, condition = "==")
CdsNameFilter(value, condition = "==")
CdsStrandFilter(value, condition = "==")
EnsemblFilter(value, condition = "==")
EnsemblprotFilter(value, condition = "==")
EnsembltransFilter(value, condition = "==")
EnzymeFilter(value, condition = "==")
EvidenceFilter(value, condition = "==")
EvidenceallFilter(value, condition = "==")
ExonChromFilter(value, condition = "==")
ExonStrandFilter(value, condition = "==")
FlybaseFilter(value, condition = "==")
FlybaseCgFilter(value, condition = "==")
FlybaseProtFilter(value, condition = "==")
GeneChromFilter(value, condition = "==")
GeneStrandFilter(value, condition = "==")
GoFilter(value, condition = "==")
GoallFilter(value, condition = "==")
IpiFilter(value, condition = "==")
MapFilter(value, condition = "==")
MgiFilter(value, condition = "==")
OmimFilter(value, condition = "==")
OntologyFilter(value, condition = "==")
OntologyallFilter(value, condition = "==")
PfamFilter(value, condition = "==")
PmidFilter(value, condition = "==")
PrositeFilter(value, condition = "==")
RefseqFilter(value, condition = "==")
TxChromFilter(value, condition = "==")
TxStrandFilter(value, condition = "==")

```

```

TxTypeFilter(value, condition = "==")
WormbaseFilter(value, condition = "==")
ZfinFilter(value, condition = "==")

## S4 method for signature 'BasicFilter'
show(object)

## S4 method for signature 'src_organism'
supportedFilters(object)

```

Arguments

| | |
|-----------|---|
| object | A BasicFilter or GRangesFilter object |
| value | Value of the filter. For GRangesFilter value should be a GRanges object. |
| condition | The condition to be used in filter for genomic extractors, one of "=", "!=", "startsWith", "endsWith", ">", "<", ">=", "<=". For character values "=", "!=", "startsWith" and "endsWith" are allowed, for numeric values (CdsStartFilter, CdsEndFilter, ExonStartFilter, ExonEndFilter, GeneStartFilter, GeneEndFilter, TxStartFilter and TxEndFilter), "=", "!=", ">", ">=", "<" and "<=". Default condition is "=". |

Details

All filters except GRangesFilter() takes value(s) from corresponding fields in the data base. For example, AccnumFilter() takes values of accession number(s), which come from field accnum. See keytypes() and keys() for possible values.

GRangesFilter() takes a GRanges object as filter, and returns genomic extractors (genes, transcripts, etc.) that are partially overlapping with the region.

supportedFilters() lists all available filters for src_organism object.

Value

A Filter object showing class, value and condition of the filter

Author(s)

Yubo Cheng.

See Also

[src_organism](#) for creating a src_organism object.

[transcripts_tbl](#) for generic functions to extract genomic features from a src_organism object.

[select,src_organism-method](#) for "select" interface on src_organism objects.

Examples

```

src <- src_organism(dbpath=hg38light())
keytypes(src)
head(keys(src, "ensembl"))

## filter by ensembl
EnsemblFilter("ENSG00000171862")

```

```
## filter by gene symbol start with "BRAC"
SymbolFilter("BRCA", "startsWith")

## filter by GRanges
GRangesFilter(GenomicRanges::GRanges("chr10:87869000-87876000"))

## filter by transcript start position
TxStartFilter(87863438, ">")
```

Genomic-Extractors *Extract genomic features from src_organism objects*

Description

Generic functions to extract genomic features from an object. This page documents the methods for [src_organism](#) objects only.

These are the main functions for extracting transcript information from a [src_organism](#) object, inherited from [transcripts](#) in GenomicFeatures package. Two versions of results are provided: [tibble](#) ([transcripts_tbl\(\)](#)) and [GRanges](#) or [GRangesList](#) ([transcripts\(\)](#)).

Usage

```
cds(x, ...)
exons(x, ...)
genes(x, ...)
transcripts(x, ...)
cds_tbl(x, filter=NULL, columns=NULL)
exons_tbl(x, filter=NULL, columns=NULL)
genes_tbl(x, filter=NULL, columns=NULL)
transcripts_tbl(x, filter=NULL, columns=NULL)
cdsBy(x, by=c("tx", "gene"), ...)
exonsBy(x, by=c("tx", "gene"), ...)
transcriptsBy(x, by=c("gene", "exon", "cds"), ...)
cdsBy_tbl(x, by=c("tx", "gene"), filter=NULL, columns=NULL)
exonsBy_tbl(x, by=c("tx", "gene"), filter=NULL, columns=NULL)
transcriptsBy_tbl(x, by=c("gene", "exon", "cds"), filter=NULL, columns=NULL)
promoters_tbl(x, upstream, downstream, filter=NULL, columns=NULL)
intronsByTranscript_tbl(x, filter=NULL, columns=NULL)
fiveUTRsByTranscript(x, ...)
fiveUTRsByTranscript_tbl(x, filter=NULL, columns=NULL)
threeUTRsByTranscript(x, ...)
threeUTRsByTranscript_tbl(x, filter=NULL, columns=NULL)

## S4 method for signature 'src_organism'
promoters(x, upstream, downstream, filter = NULL, columns = NULL)

## S4 method for signature 'src_organism'
intronsByTranscript(x, filter = NULL, columns = NULL)
```

Arguments

| | |
|------------|--|
| x | A <code>src_organism</code> object |
| upstream | For <code>promoters()</code> : An integer(1) value indicating the number of bases upstream from the transcription start site. |
| downstream | For <code>promoters()</code> : An integer(1) value indicating the number of bases downstream from the transcription start site. |
| filter | Either <code>NULL</code> , <code>AnnotationFilter</code> , or <code>AnnotationFilterList</code> to be used to restrict the output. Filters consists of <code>AnnotationFilters</code> and can be a GRanges object using <code>"GRangesFilter"</code> (see examples). |
| columns | A character vector indicating columns to be included in output <code>GRanges</code> object or <code>tbl</code> . |
| by | One of <code>"gene"</code> , <code>"exon"</code> , <code>"cds"</code> or <code>"tx"</code> . Determines the grouping. |
| ... | Additional arguments to <code>S4methods</code> . In this case, the same as <code>filter</code> . |

Value

functions with `_tbl` return a [tibble](#) object, other methods return a [GRanges](#) or [GRangesList](#) object.

Author(s)

Yubo Cheng.

See Also

[src_organism](#) for creating a `src_organism` object.

Examples

```
## Not run: src <- src_ucsc("human")
src <- src_organism(dbpath=hg38light())

## transcript coordinates with filter in tibble format
filters <- AnnotationFilter(~symbol == c("A1BG", "CDH2"))
transcripts_tbl(src, filters)

transcripts_tbl(src, AnnotationFilter(~symbol %startsWith% "SNORD"))
transcripts_tbl(src, AnnotationFilter(~go == "GO:0005615"))
transcripts_tbl(src, filter=AnnotationFilter(
  ~symbol %startsWith% "SNORD" & tx_start < 25070000))

## transcript coordinates with filter in granges format
filters <- GRangesFilter(GenomicRanges::GRanges("chr15:1-25070000"))
transcripts(src, filters)

## promoters
promoters(src, upstream=100, downstream=50,
  filter = SymbolFilter("ADA"))

## transcriptsBy
transcriptsBy(src, by = "exon", filter = SymbolFilter("ADA"))

## exonsBy
exonsBy(src, filter = SymbolFilter("ADA"))
```

```
## intronsByTranscript
intronsByTranscript(src, filter = SymbolFilter("ADA"))
```

hg38light

Utilities used in examples, vignettes, and tests

Description

These functions are primarily for illustrating functionality. `hg38light()` and `mm10light()` provide access to trimmed-down versions of `Organism.dplyr` data based derived from the `TxDb.Hsapiens.UCSC.hg38.knownGene` and `TxDb.Mmusculus.UCSC.mm10.ensGene` data bases.

Usage

```
hg38light()
```

```
mm10light()
```

Value

character(1) file path to the trimmed-down data base

Examples

```
hg38light()
mm10light()
```

keytypes,src_organism-method

Using the "select" interface on src_organism objects

Description

`select`, `columns` and `keys` can be used together to extract data from a [src_organism](#) object.

Usage

```
## S4 method for signature 'src_organism'
keytypes(x)
```

```
## S4 method for signature 'src_organism'
columns(x)
```

```
## S4 method for signature 'src_organism'
keys(x, keytype, ...)
```

```
select_tbl(x, keys, columns, keytype)
```

```
## S4 method for signature 'src_organism'
select(x, keys, columns, keytype)

## S4 method for signature 'src_organism'
mapIds(x, keys, column, keytype, ..., multiVals)
```

Arguments

| | |
|------------------------|--|
| <code>x</code> | a <code>src_organism</code> object |
| <code>keytype</code> | specifies the kind of keys that will be returned. By default keys will return the keys for schema of the <code>src_organism</code> object. |
| <code>...</code> | other arguments. These include: <code>pattern</code> : the pattern to match. <code>column</code> : the column to search on. <code>fuzzy</code> : TRUE or FALSE value. Use fuzzy matching? (this is used with <code>pattern</code>) |
| <code>keys</code> | the keys to select records for from the database. All possible keys are returned by using the <code>keys</code> method. |
| <code>columns</code> | the columns or kinds of things that can be retrieved from the database. As with <code>keys</code> , all possible columns are returned by using the <code>columns</code> method. |
| <code>column</code> | <code>character(1)</code> the column to search on, can only have a single element for the value |
| <code>multiVals</code> | What should <code>mapIds</code> do when there are multiple values that could be returned. Options include: <code>first</code> : when there are multiple matches only the 1st thing that comes back will be returned. This is the default behavior. <code>list</code> : return a list object to the end user <code>filter</code> : remove all elements that contain multiple matches and will therefore return a shorter vector than what came in whenever some of the keys match more than one value <code>asNA</code> : return an NA value whenever there are multiple matches <code>CharacterList</code> : returns a <code>SimpleCharacterList</code> object <code>FUN</code> : can also supply a function to the <code>multiVals</code> argument for custom behaviors. The function must take a single argument and return a single value. This function will be applied to all the elements and will serve a 'rule' that for which thing to keep when there is more than one element. So for example this example function will always grab the last element in each result: <code>last <- function(x){x[[length(x)]]}</code> |

Details

`keytypes()`: discover which keytypes can be passed to `keytype` argument of methods `select` or `keys`.

`keys()`: returns keys for the `src_organism` object. By default it returns the primary keys for the database, and returns the keys from that `keytype` when the `keytype` argument is used.

`columns()`: discover which kinds of data can be returned for the `src_organism` object.

`select()`: retrieves the data as a tibble based on parameters for selected keys columns and `keytype` arguments. If requested columns that have multiple matches for the keys, '`select()`' will return a tibble with one row for each possible match.

`mapIds()`: gets the mapped ids (`column`) for a set of keys that are of a particular `keytype`. Usually returned as a named character vector.

Value

keys, columns and keytypes each returns a character vector of possible values. select returns a tibble.

Author(s)

Yubo Cheng.

See Also

[AnnotationDb-class](#) for more descriptions of methods select, keytypes, keys and columns.

[src_organism](#) for creating a src_organism object.

[transcripts_tbl](#) for generic functions to extract genomic features from a src_organism object.

Examples

```
## Not run: src <- src_organism("TxDb.Hsapiens.UCSC.hg38.knownGene")
src <- src_organism(dbpath=hg38light())

## keytypes
keytypes(src)

## columns
columns(src)

## keys
keys(src, "entrez")

keytype <- "symbol"
keys <- c("ADA", "NAT2")
columns <- c("entrez", "tx_id", "tx_name", "exon_id")

## select
select_tbl(src, keys, columns, keytype)
select(src, keys, columns, keytype)

## mapIds
mapIds(src, keys, column = "tx_name", keytype)
```

src_organism

Create a sqlite database from TxDb and corresponding Org packages

Description

The database provides a convenient way to map between gene, transcript, and protein identifiers.

‘select_tbl_organism()’ is DEPRECATED, please use ‘select()’.

Usage

```

src_organism(txdb = NULL, dbpath = NULL, overwrite = FALSE)

src_ucsc(organism, genome = NULL, id = NULL, dbpath = NULL, verbose = TRUE)

supportedOrganisms()

## S3 method for class 'tbl_organism'
select_(.data, ...)

## S3 method for class 'src_organism'
src_tbls(x, ...)

## S3 method for class 'src_organism'
tbl(src, from, ...)

## S4 method for signature 'src_organism'
orgPackageName(x)

## S4 method for signature 'src_organism'
seqinfo(x)

```

Arguments

| | |
|-----------|---|
| txdb | character(1) naming a TxDb.* package (e.g., TxDb.Hsapiens.UCSC.hg38.knownGene) or a TxDb object instantiating the content of a TxDb.* package. |
| dbpath | character(1) path or BiocFileCache instance representing the location where an Organism.dplyr SQLite database will be accessed or created. If no path is specified, the SQLite file is created in the default BiocFileCache() location. |
| overwrite | logical(1) overwrite an existing 'dbpath' contains an Organism.dplyr SQLite database different from the version implied by 'txdb'? |
| organism | organism or common name |
| genome | genome name |
| id | choose from "knownGene", "ensGene" and "refGene" |
| verbose | logical. Should R report extra information on progress? Default is TRUE. |
| .data | A tbl. |
| ... | Comma separated list of unquoted expressions. You can treat variable names like they are positions. Use positive values to select variables; use negative values to drop variables. |
| x | A src_organism object |
| src | An src_organism object |
| from | character(1) name of temporary table in 'src'. |

Details

src_organism() and src_ucsc() are meant to be a building block for [src_organism](#), which provides an integrated presentation of identifiers and genomic coordinates.

src_organism() creates a dplyr database integrating org.* and TxDb.* information by given TxDb. And src_ucsc() creates the database by given organism name, genome and/or id.

supportedOrganisms() provides all supported organisms in this package with corresponding OrgDb and TxDb.

The 'tbl.src_organism()' parameter 'load_tbl_only' has been removed. The function behaves as 'load_tbl_only = FALSE' (the previous default); for 'load_tbl_only = TRUE', use 'tbl(src\$con, ...)'

Value

src_organism() and src_ucsc() returns a dplyr src_dbi instance representing the data tables.

A tibble of the requested table coming from the temporary database of the src_organism object.

Author(s)

Yubo Cheng.
